SNAPSHOT

Software engineer in training with hands-on experience building production-ready systems, from client-facing websites to microservice architecture. Built and deployed a live business website, designed a 12-service platform using Spring Boot and Docker, and developed full-stack applications serving real-world use cases. Comfortable moving across frontend, backend, databases, and deployment environments to turn ideas into working products.

EDUCATION

B.Sc. (Hons) in Electronics and Computer Science

July 2023 - (Present)

University of Kelaniya

- Core Focus: Merging low-level system logic with modern web architecture.
- Theory in Practice: Actively applying classroom concepts in Data Structures, AI, and Full-Stack Architecture directly to live-production client apps.

TECHNICAL SKILLS

Languages: Java | Python | JavaScript | TypeScript | C | PHP

Web & Frameworks: HTML5 | CSS3 | React | Next.js | Node.js | Spring Boot | TailwindCSS

Databases: MySQL | PostgreSQL

Tools & Platforms: Git | GitHub | Docker | Vite

PROJECTS

Sri Lankan Wedding Marketplace Platform | TypeScript • Java • Spring Boot • React • Docker

- 12 microservices, one platform — auth, listings, chat, calendar, notifications, analytics, financials, and reviews all running independently and communicating via REST APIs.
- Wired up Spring Cloud Eureka for service discovery and an API Gateway so no client ever talks directly to a service.
- Frontend in React/TypeScript with real-time chat, live vendor search, and calendar-based booking.
- Entire stack containerized with Docker Compose — one command to spin up the whole system.

Rangiri Iron Works — Live Client Website | Next.js • TypeScript • TailwindCSS

- A real client. A real deadline. A real website — built and shipped for an active Sri Lankan workshop business.
- Chose Next.js for server-side rendering so the site loads fast and ranks on Google out of the box.

- Fully responsive across all screen sizes; the client uses it daily to showcase services and receive enquiries.

QR-Based Smart Restaurant Ordering System | Node.js • React • Vite • PostgreSQL • Prisma • TailwindCSS

- Customers scan a QR code, order from their phone, no account needed — the whole point was to cut staff overhead and speed up service.
- Node.js backend with PostgreSQL; React/Vite frontend with TailwindCSS.
- Real-time kitchen dashboard in progress using Socket.io — orders will push live without page refresh.

Phone Shop Inventory & POS System | Java

- Desktop POS for a phone retailer — handles stock, sales, and reporting without internet dependency.
- Object-oriented design throughout; built to be maintainable, not just functional.

WHAT I BRING

I've shipped code for a real client while still studying. I've broken a monolith into 12 services and put the whole thing in Docker. I debug things I've never seen before because I enjoy the process. I communicate clearly, I push commits regularly, and I don't wait to be told what to do next.
